What is a power bank?
A portable charger or power bank is a device used to charge a mobile phone, tablet, or other electronic device when plugging into a wall outlet isn’t possible.

How do you use a power bank?
Follow these steps and never again be without power!

1. Charge the power bank ahead of time with the included charging cable.
2. Simply connect one end of a compatible charging cable to the power bank, plug into the outlet, and then connect the other end to your device.
3. Power up. Never deal with a dead battery again!

Which power bank is right for your customers’ and team’s gadgets?
Consider these three factors:

1. Do they want to charge a mobile phone, tablet or both (Amp output speed)
Tablets, having bigger batteries, are designed to charge at a faster speed and are best teamed with a 2.1-amp (rated) power bank.
Mobile phones, having smaller batteries, don’t require 2.1 amps, so a 1-amp power bank is the best option.

2. How much power do they want to charge? (mAH capacity)
Think of mAH as an expression of battery power.
Mobile and tablet devices contain batteries of slightly different sizes. The mAH capacity is listed on the device. For example, an iPhone® 12 has 2455 mAH battery capacity and a Microsoft Surface Pro 7 has 7562 mAH battery capacity.

3. Is the power bank UL Listed?
Look for power banks that are UL Listed and carry the UL Listing Certification Mark. This means that the product has been evaluated by Underwriter Laboratories and meets applicable safety standards.

Power banks: On-the-go charging—anywhere, anytime.
